

Cerebyl mobile — build exactly this

Fifteen approved screens. Each section shows the design on the left and the instructions on the right. The picture is the **live component**, not a screenshot — build until yours matches it.

Read this before you write any code. A previous attempt applied the structure of these designs (tabs, disclosures) but kept the old visuals underneath — old hero cards, old chip rows, old row styling. The result matched the shape and not the substance. **Replace the inner markup, do not wrap it.**

The eight rules, in priority order

#	Rule	Why
1	Every tappable thing is $\geq 44 \times 44\text{px}$	Below that, taps miss and the app feels broken
2	Raise the SIZE, never the WEIGHT	300 body / 350 data / 450 headings / 500 labels / 550 one big figure. <code>font-bold</code> is banned
3	13px is the floor; 14–16px for sentences	Never <code>text-[10px]</code> or <code>text-[11px]</code>
4	Secondary text is transparent, not grey	<code>color-mix(in srgb, var(--st-on-surface-variant) 72%, transparent)</code>
5	Exactly one primary action per screen	Four blue buttons means none is primary
6	Keep the depressed inset and neumorphic recipes	<code>inset 0 1.5px 3px rgba(0,0,0,.06)</code> and the white top highlight are the brand
7	Fixed option sets never scroll	4 or 6 options = a segmented grid. Scrollers are for open-ended lists
8	A bleed utility inside a bled parent must be the inset variant	Two negative margins compound and push content off-screen

Parity contract. Every field and action that exists today must still exist. Things may move to a tab, a sheet or an overflow menu — nothing may disappear. In each commit message, list every field you moved and where it went.

Verify every ticket

`npx tsc --noEmit` (0 errors) · `npm run test` (all pass) · `npm run build`. Then **open it at 375 × 812 and look at it**. A green build has repeatedly passed work that was visually wrong.

Bottom tab bar

src/components/app-shell.tsx · src/routes/portal.tsx

Staff tab bar — active tab in a depressed well

Build

Icons **22px**, `strokeWidth=1.75` .

Active tab: the icon sits in a **56 × 32 depressed well** — `background:#e3ecf8` , `box-shadow: inset 0 1.5px 3px rgba(24,119,242,.16)` , `border-radius: 9999px` . The label stays *outside* the well.

Labels 11px. **Active weight 500, inactive weight 300.**

Bar min-height **64px** plus `pb-safe` .

Badges: `min-h/w 17px` , 10px text, and a **1.5px white ring**(`box-shadow: 0 0 0 1.5px rgba(255,255,255,.98)`) so they do not bleed into the icon.

Orders icon is `ReceiptIndianRupee` , never `Receipt` — that one draws a dollar sign.

More icon is `MoreHorizontal` , never the hamburger.

Do not use a tinted rounded rectangle behind icon *and* label. That was the rejected version.

Page header

```
src/components/section-header-shell.tsx
```

Header A — three rows on mobile

Build

Three deliberate rows on mobile. Desktop keeps its single inline row.

Row 1 — 40px brand icon tile · page title (22px / weight 450) · **one** primary button · **...** overflow (40px circle).

Row 2 — lens tabs, full width, 44px tall, 14px labels, active 500 / inactive 300, in a white pill bar.

Row 3 — 44px search field in a depressed well, plus a filter icon carrying a **count badge** of filters actually applied.

What goes in the overflow

Everything that is not the primary: the grid/list toggle (a segmented control, **grid default**), Import, Quick enquiry, Select, Bulk import, exports.

Mobile button labels drop the section name — **“New”**, not “New Party”. The page title is two rows above it.

More sheet

```
src/components/app-shell.tsx
```

Variant D — account-led

Build

One dismiss affordance only. Keep the drag handle, pass `showClose={false}` so the corner X is not rendered.

Opens with the **account card** in a depressed well: initials avatar, name (15px/450), role · company (13px/300), Settings as a 40px icon button.

Then `SECTIONS` label, then rows: 40px icon tile in a well, 15px label, chevron, **52px minimum row height**.

Divider, then **Sign out** in destructive red with a rose icon tile.

Product price block

src/routes/portal.product.\$productId.tsx

Variant D — one figure, breakdown on tap

The rate model — read carefully

Shown as	Column	Meaning
MRP	mrp	Market retail price. Nothing to do with what they pay.
Rate	list_rate (= base_rate)	The company's selling price to any distributor.
Your rate	rate when is_special_rate	Their negotiated rate, from product_party_rates .

PTR is never shown here. And a negotiated rate at or above the list rate is a data fault, not a discount — fall back to showing the plain list rate: `const ydr = p.ydr != null && p.ydr < p.pts ? p.ydr : null;`

- One figure at **30px / weight 550**, labelled “your rate” or “list rate”.
- A chip on the right: *Negotiated · N% off*, or *List price*.
- A 44px **“Price breakdown”** disclosure revealing MRP, list rate and your rate as plain rows.

Lead sheet

src/routes/leads.all.tsx — LeadPeekDrawer

Variant B — Profile / Pipeline / Activity

This is the reference for every detail sheet. The client and order sheets must use the identical framework.

Build, top to bottom

- Drag handle** only — no corner X.
- Identity strip** replacing the old avatar hero: 44px initials circle in a well, name 16px/450, phone 13px/300 with a copy icon, then **Call as a solid blue 42px circle** and WhatsApp as a white 42px circle. Only Call is filled.
- Chip row:** code, status, temperature (with a colour dot), rep, source. All 12px, depressed inset, no borders.
- Tab pills** in a depressed well: Profile / Pipeline / Activity, 36px, active white with a lift shadow.
- Rows:** label left (13px/300 transparent), value right (13px/400). Never a two-column card grid.
- Stage** = 7 chips in `h-scroller-inset` with an edge fade.**Temperature** = `grid-cols-4` segmented control, never a scroller.
- Dock:** Log Call Activity full width, then Convert / Edit side by side, then the text link *Open full lead details ->*.

Leads page

```
src/routes/leads.all.tsx
```

Variant B — filters behind a badged control

Build

Header per Section 2. **Add** is the only primary.

Filters (stage, temperature, rep, sort, save view) collapse on phones behind one 44px filter control with a badge counting **applied** filters.

The badge must compare sort against the *per-lens* default — `next_followup` on Call List, `received_desc` elsewhere — or the Call List shows a phantom “1 applied”.

Cards: name 16px/450, firm 13px/300, exactly **two chips**(stage + temperature), follow-up right-aligned and red when overdue.

Lead card

src/routes/leads.all.tsx – LeadCard

Variant A — five items, two chips

Build

At most **five information items and two chips**.
Keep: name, firm, temperature chip, stage chip, follow-up line, duplicate icon.
Remove from the card: phone, area, product interest, lead code, SLA badge. **They stay on the peek drawer and the detail page** — this is a card discipline change, not a data removal.

Client sheet

src/routes/clients.parties.tsx – PartyPeekDrawer

Same framework as the lead sheet

Build

Identical framework to Section 5. Same handle, identity strip, chip row, tab pills, row styling and dock shape.

Chips: type, status and rep only. The `#DIS` chip is removed — it merely truncated the type chip beside it. The star moves off the header into the badges row.

Remove the party-classification selector from the sheet entirely. It stays on the full client page.

Money is a **row**: *Outstanding* left, overdue chip and amount right. No large two-tile block.

Tabs: Overview (financial, important date) / Compliance (GSTIN, licence, credit, documents, contact, rep) / Notes.

Dock: New Order primary, Record Payment + Edit Party, then *Open full client details* →.

Orders page

src/routes/orders.all.tsx

Variant C — neutral Summary disclosure

Build

The three KPI cards used ~450px before the first order. On phones they collapse behind a **plain SUMMARY label and chevron**.
No alert colour. These are figures, not alarms — no red block, no icon tile.
Open state: one row per KPI — label left, value and subtext right.
Desktop keeps the 3-up grid.

Order sheet

src/routes/orders.all.tsx — OrderPeekDrawer

Variant D — status first

Build

Same sheet framework as Section 5.

Fulfilment status comes first, in a depressed well: truck icon, stage name in blue 16px/450, then items and destination.

Financial breakdown *below* it, as rows: Total, Paid, Balance due (red). Not three tiles.

Dock: Share + Record payment, then *Open full order details* →.

Create lead

```
src/components/lead-dialog.tsx
```

Create new lead

Details Follow-ups

DATE RECEIVED

02 / 09 / 2026

ASSIGNED REP

Aarav Enthral

CONTACT NAME

e.g. Dr. Rajesh Sharma

FIRM NAME

e.g. Apex Pharma Agencies

Swipe down asks before discarding.

Cancel Create Lead

Variant A — tabbed bottom sheet

The only item here that changes behaviour.

Test it hardest: a broken create-lead blocks real work.

Build

Becomes a **bottom sheet**, matching the Details / Follow-ups tab split it has today.

Dock is pinned below the scroll area so the keyboard can never bury Create Lead.

Phone field: `inputMode="numeric"` and `pattern="[0-9]*"`.

Fields 44px, 15px text, labels 10.5px uppercase.

A swipe-down on a part-filled form must confirm before discarding. Track dirty state and intercept `onOpenChange`.

Every field survives: Date Received, Assigned Rep, Contact Name, Firm Name, Phone, City/Area, State, follow-ups, Cancel, Create Lead.

Portal access

```
src/routes/clients.portal-access.tsx
```

Variant A — one card per firm

Build

The table is `min-w-[800px]` : on a phone firm names wrapped to three lines and the status column was cut off. Phones get **one card per firm**; the table becomes desktop-only.
Card: firm 16px/450 · city · rep 13px/300 · status chip right · login email in mono 13px · then a full-width 44px action — **Create login** (blue) or **Disable / Reset** side by side.

Share one implementation. Lift the row's state and handlers into a hook used by both the row and the card. These actions create and reset real credentials; two copies that drift is a security problem, not a styling one.

Territory map

```
src/routes/clients.territories.tsx
```

Variant B — floating action, bottom-left

Build

Map gets the height back: **Place hold floats on the canvas at bottom-left**, 36px tall, 13px label — not a toolbar row.

Bottom-left is deliberate: Leaflet puts zoom top-left and attribution bottom-right.

z-index: 500 . Leaflet's own panes reach 400 — anything lower renders under the tiles and cannot be tapped.

Desktop keeps Place hold in the toolbar.

Already fixed, do not regress: every `MapContainer` needs an `invalidateSize()` pass on mount plus a `ResizeObserver` . Without it Leaflet caches a zero-size container and renders only a corner.

Product cards

```
src/routes/portal.catalogue.tsx
```

A — catalogue row · B — similar products

Build

A (catalogue list): 72px square image on a neutral tile, name 16px/450 max two lines, pack 13px/300, rate 18px/550, then the heart and a 44px Add button.

B (two-up tile): used only for *similar products* on the product page. Square image on top, 14px name, 17px rate, full-width Add.

Images are always `aspect-square` with `object-contain` — never `object-cover`, which crops a pack shot.

Exactly five items per card. Composition, division, PTR and PTS belong on the product page.

Order tracking

```
src/routes/portal.orders.$orderId.tsx
```

Variant A — vertical stepper

Build

A reassurance header in plain English above the stepper. **Never invent an ETA** — if the schema has no expected date, state only what is known ("Dispatched 2 September").

Vertical stepper, one column. Completed stages: filled blue 24px dot with a tick and a timestamp. Current stage: blue 15px/500. Future: 300 weight, transparent, hollow dot.

Connector is a 1px line, blue at 45% between completed stages and 12% after.

Cancelled or rejected renders as an explicit terminal state, not a stepper frozen at step 1.

Below: a contact card with the rep and 44px Call / WhatsApp buttons.

Order of work

Phase	Sections	Why this order
1	1, 2, 3	Shell. Every screen inherits it.
2	5, 6, 7	Leads. Section 5 becomes the reference all other sheets copy.
3	8, 9, 10	Clients and Orders, reusing the Section 5 framework.
4	4, 12, 13, 14, 15	Portal and the remaining staff screens.
5	11	Create lead last — it is the only behavioural change.

Definition of done, per section: tsc 0 · tests pass · build passes · opened at 375 × 812 and compared side by side with the picture in this document · desktop checked unchanged · every moved field listed in the commit message.
